

## **Project 2: Milestone 1**

**Name of App:** myfitnesspup

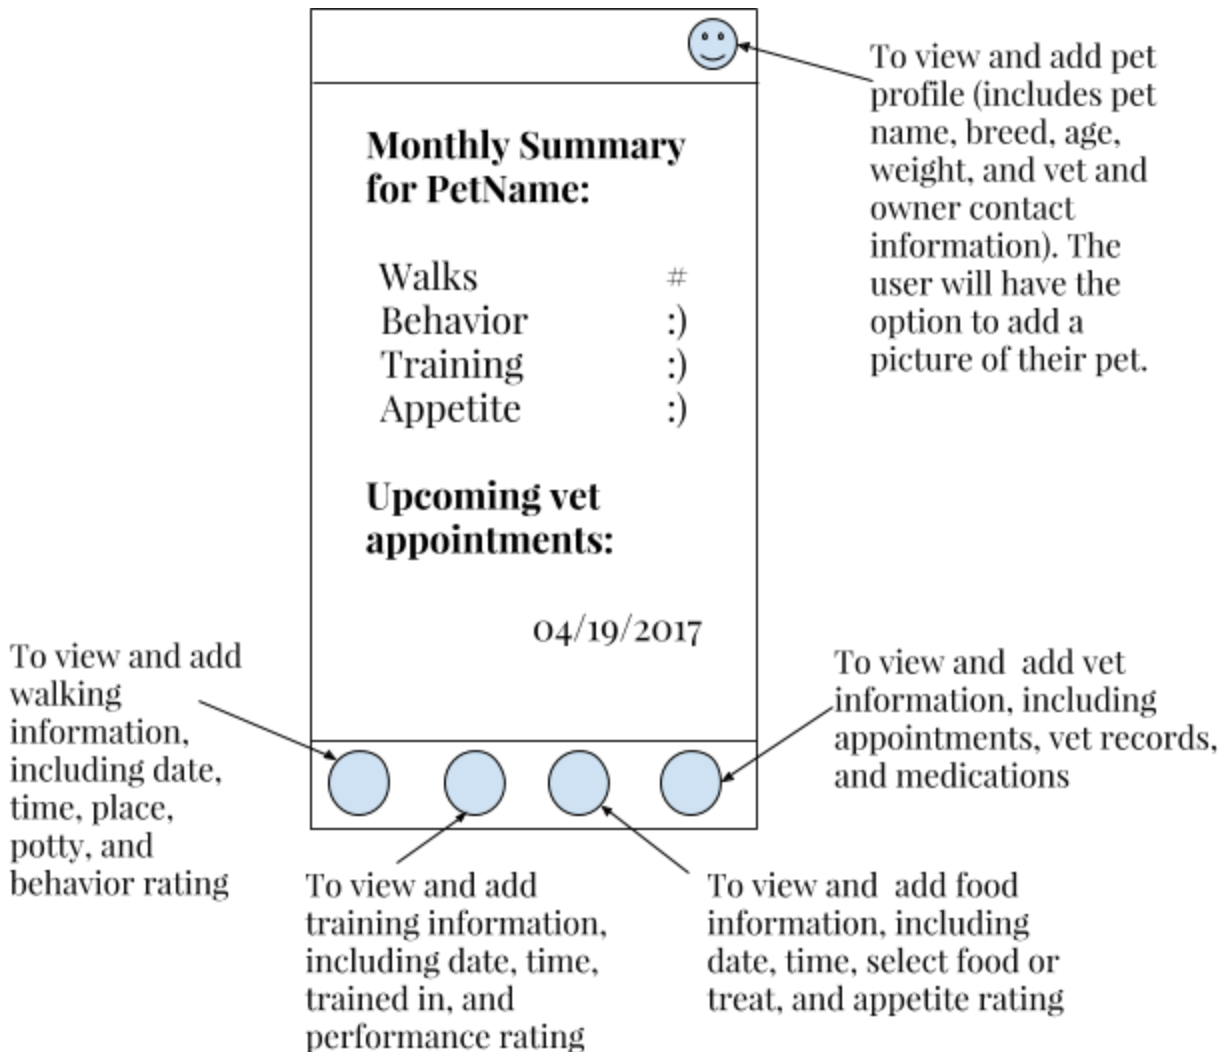

**Description:** With myfitnesspup, the user will be able to track their dog's health. The user will be able to customize their dog's profile, add important information (ie. vet records, allergies), and be able to track food, walks, and training. The data entered by the user will be persistent. When the user first enters the app, the user will view a monthly summary of the dog's walks, training, and behavior. The user will also be able to quickly view any upcoming vet appointments. When the user selects the different tabs, the user will be able to view a daily summary of the entries. The user will also be able to add information for each section.

**Inspiration:** Since my dog has many issues, I have found it useful to track his activity in order to pinpoint specific triggers for his anxiety.

**Goal:** The purpose of this app is to provide the user with a health profile for their pet in an effort to increase awareness and improve the dog's quality of life.

**Intended Audience:** The intended audience for this app is for anyone who has a dog and wishes to track their health.

## Visual Design:

## Resources:

- <https://developer.android.com/design/index.html>
- I will also attempt to integrate Firebase into the app.
