Project 3: Milestone 1

**Name of App:** myfitnesspup for iOS

Description: For Project 3, I will re-create myfitnesspup for the iPhone. With myfitnesspup, the user will be able to track their dog's health. The user will be able to customize their dog's profile, add important information (ie. vet records, allergies), and be able to track food and activity level. The data entered by the user will be persistent. When the user selects the different tabs, the user will be able to view a daily summary of the entries. The user will also be able to add information for each section.

Inspiration: Since my dog has many issues, I have found it useful to track his activity in order to pinpoint specific triggers for his anxiety.

Goal: The purpose of this app is to provide the user with a health profile for their pet in an effort to increase awareness and improve the dog's quality of life.

Intended Audience: The intended audience for this app is for anyone who has a dog and wishes to track their health.

Visual Design:

To view and add pet profile (includes pet name, breed, age, weight, and vet and owner contact information). The user will have the option to add a picture of their pet.

To view and add walking information, including date, time, place, potty, and behavior rating

To view and add vet information, including appointments, vet records, and medications

To view and add training information, including date, time, trained in, and performance rating

To view and add food information, including date, time, select food or treat, and appetite rating

Resources:
- TabLayout on iOs
- Possibly use Firebase for data persistence
